

Vitamin C and the Common Cold (book)

From Wikipedia, the free encyclopedia

Vitamin C and the Common Cold is a popular book by Linus Pauling, first published in 1970, on vitamin C, its interactions with common cold and the role of vitamin C megadosage in human health.^[1] The book promoted the idea that taking large amounts of vitamin C could reduce the duration and severity of the common cold. A Nobel Prize-winning chemist and activist, Pauling promoted a view of vitamin C that is strongly at odds with most of the scientific community, which found little evidence for the alleged health benefits of greatly increased vitamin C intake. The book went through multiple editions, and a revised version that discussed the flu and other diseases, retitled *Vitamin C, the Common Cold & the Flu*, came out in 1976.^[2]

The book characterizes the inability of humans and some other animals to produce vitamin C in terms of evolution and Pauling's concept of "molecular disease" (first articulated in his 1949 study, "Sickle Cell Anemia, a Molecular Disease"). Pauling argues that the loss of vitamin C synthesis first arose as a molecular disease, because of a genetic mutation that resulted in the loss of the biochemical capacity to make the vitamin, but because diets of the primate ancestors of humans consisted of high levels of vitamin C from plant sources, the loss of that biochemical mechanism was not harmful and may have even been beneficial. He argues, however, that the subsequent shift to a high-meat, lower-plant diet resulted in widespread vitamin C deficiency.^[3]

Research, writing and revisions

Pauling began studying vitamin C mega-dosage, and orthomolecular medicine more broadly, after he was contacted in 1966 by biochemist Irwin Stone, who suggested that taking enough vitamin C would let him live another fifty years. Pauling reinterpreted the large body of research on vitamin C based on comparative studies of the biochemical genetics of vitamin C synthesis in different species, as well his own theories about "molecular disease" and recent developments in molecular evolution. He criticized the design of studies that did not find positive results for vitamin C mega-dose treatment, and promoted those that did. He and other vitamin C advocates thought the vitamin boosts the body's ability to fight all kinds of infection. By 1970, after following Stone's regimen for 4 years and studying and debating the issue extensively, Pauling was sure enough that organized medicine had it wrong that he wrote *Vitamin C and the Common Cold* to popularize his vitamin C message.^[4]

In 1970, he found an in-depth 1942 study from public health researcher at the University of Minnesota, "Vitamins for the Prevention of Colds", which became a focal point for his subsequent criticism of what he saw as flawed vitamin C research.^[5] One chapter was added to the second edition in 1971. By 1976, following confrontations with researchers holding to the mainstream view of vitamin C, Pauling expanded the book to include evidence related to a wide variety of other illnesses, and the flu in particular. That edition and a further revision in 1981 were issued under the title *Vitamin C, the Common Cold & the Flu*.^[6]

Reception

The book was well received by the public and garnered considerable popular attention, resulting in a rush of vitamin C sales. Paperback editions were issued in 1971 and 1973, and Pauling subsequently authored several related books: *Vitamin C and Cancer* (1979) and *How to Live Longer and Feel Better* (1986).

The book and Pauling himself faced considerable criticism from scientists and physicians.^[7] Three studies by the Mayo Clinic found that patients given 10,000 mg of vitamin C daily did no better than those given a placebo.^[8]
